This has been shown to depend upon the action of certain bacteria, notably the Micrococcus urea? and the Bacterium urea?, which are present in the air.³ These organisms cause decomposition of the urea found in every urine, with the formation of ammonium carbonate, according to the following equations: $\text{CO}(\text{NH}_2)_2 + 2\text{H}_2\text{O} = (\text{NH}_4)_2\text{CO}_3$, 1 E. Salkowski u. J. Munk, Virchow's Archiv, 1877, vol. lxxvi. p. 500. 'Quincke. Zeit. f. klin. Med., vol. vii. 3 W. An alkaline urine, the alkalinity of which is not due to ammoniacal fermentation, however, but to other causes, as indicated above, may, of course, undergo the same change as an acid urine; but it is necessary to distinguish sharply between these two varieties of alkaline urines, as the recognition of the cause of the alkalinity is very often most important in diagnosis. The distinction is readily made by fastening a piece of sensitive red litmus-paper in the cork of the bottle containing the urine. If the alkalinity of the urine is due to the presence of ammonia, the litmus-paper will turn blue, but soon changes to red when exposed to the air; while a urine, the alkalinity of which is due to the presence of fixed alkalies, will turn red litmus-paper blue only when immersed in the urine, the change in color at the same time persisting. As ammoniacal decomposition can also occur within the urinary passages, it is important, whenever an alkaline reaction due to the presence of ammonia is observed, to test the urine at once upon being...
