hmh into math grade 3: Digital Games and Mathematics Learning Tom Lowrie, Robyn Jorgensen (Zevenbergen), 2015-10-05 Digital games offer enormous potential for learning and engagement in mathematics ideas and processes. This volume offers multidisciplinary

perspectives—of educators, cognitive scientists, psychologists and sociologists—on how digital games influence the social activities and mathematical ideas of learners/gamers. Contributing authors identify opportunities for broadening current understandings of how mathematical ideas are fostered (and embedded) within digital game environments. In particular, the volume advocates for new and different ways of thinking about mathematics in our digital age—proposing that these mathematical ideas and numeracy practices are distinct from new literacies or multiliteracies. The authors acknowledge that the promise of digital games has not always been realised/fulfilled. There is emerging, and considerable, evidence to suggest that traditional discipline boundaries restrict opportunities for mathematical learning. Throughout the book, what constitutes mathematics learnings and pedagogy is contested. Multidisciplinary viewpoints are used to describe and understand the potential of digital games for learning mathematics and identify current tensions within the field. Mathematics learning is defined as being about problem solving; engagement in mathematical ideas and processes; and social engagement. The artefact, which is the game, shapes the ways in which the gamers engage with the social activity of gaming. In parallel, the book (as a textual artefact) will be supported by Springer's online platform—allowing for video and digital communication (including links to relevant websites) to be used as supplementary material and establish a dynamic communication space.

hmh into math grade 3: Science Education Through Multiple Literacies Joseph Krajcik, Barbara Schneider, 2022-10-18 Science Education Through Multiple Literacies explores how the use of project-based learning in elementary science education fosters a lifelong scientific mindset in students. The book provides educators with the teaching practices to help students develop an overall science literacy that aligns with Next Generation Science Standards. Editors Joseph Krajcik and Barbara Schneider and the book's contributors offer a comprehensive overview of the multifaceted approach to science learning. Multiple Literacies in Project-Based Learning (ML-PBL) interweaves scientific ideas and practices, language literacy, and mathematical thinking. ML-PBL supports the teaching of science by paralleling what scientists do: it engages students and their teachers in investigating real-world questions, constructing models, and using evidence to evaluate claims. The book presents compelling case studies of ML-PBL, how teachers use this approach, and how the ML-PBL transforms the classroom into an environment that builds and supports academic and student social-emotional learning. Representing both urban and suburban schools, the case studies include classroom observations, student and teacher interviews, and student artifacts to illustrate how to make science relevant in students' lives. Krajcik and Schneider note that application of ML-PBL requires intentional instructional practices and new ways of thinking about what it means to learn. Easing this challenge, the editors equip elementary science teachers with curricular resources including high-quality instructional materials, professional-learning exercises, and formative assessments. Science Education Through Multiple Literacies provides the necessary elements to transform science teaching and learning so that students learn the skills to navigate with confidence through our complex world.
